The Art Of PROMPT CRAFTING

When it comes to Ai art, the prompt is crucial in guiding the machine learning algorithm in creating the desired output. Crafting a good prompt is key to producing high-quality Ai art. The prompt should be specific enough to provide direction to the algorithm, but not so rigid that it restricts creativity. A well-crafted prompt should take several things into account aside from the subject. The subject's surroundings, environment, weather, lighting, all affect the final result.

One way to craft an effective prompt for Ai art is to start with a clear idea of the desired output. This can involve considering the subject matter, color palette, style, and mood of the artwork. Once these elements are established, the prompt can be constructed to provide direction to the algorithm in generating the artwork. For example, a prompt for a landscape painting might include keywords like "mountains", "sunset", and "vibrant colors", while a prompt for a portrait might include keywords like "soft lighting", "neutral background", and "emotional expression".

The following prompt created the image on the right.

/imagine Photograph of white sand dunes in the evening before sunset as the blue sky starts to turn orange. Spots of Green grass cover the white wavy sand --ar 2:3.

Ai delivered everything that was asked of it, and more. It even takes into account composition as well. Even when it's not requested on the prompt, Ai places the objects of interest in a zone of where it would be pleasing to the eye, according to the golden ratio. Commonly known as the phi grid, the image is divided into nine rectangles along two horizontal and vertical lines, and the points of interest would go where the lines intersect. In this case, where the bushes are in the photograph.
